
djig Documentation

Release 0.0a6

Barry Melton

March 06, 2013

CONTENTS

1	Installation	3
2	Configuration	5
3	Indices and tables	7

Djig is a minimalist, Digg-like news aggregator (old Digg, not new) for letting users submit content. Currently in a fairly alphaish state, not recommended for use.

Djig includes a `search_indexes.py` file and a couple of example search templates for use with Django-Haystack. Haystack is not a requirement, and lack of its presence should not cause any harm, but may be used if search is needed. You will need to at least `update_index` after installing Djig.

Note: Djig is in alpha release. It may have undeclared dependencies, reference variables that do not exist, or lay waste to your server, database, or the innocence of your daughter.

INSTALLATION

```
pip install djig
```

CONFIGURATION

Add `djig` to `INSTALLED_APPS`

```
INSTALLED_APPS = {  
    [...],  
    'djig',  
}
```

Add `djig.urls` to your root `urls.py`. I have mine as `'news'`, like this:

```
url('^news/', include('djig.urls', namespace='news')),
```

INDICES AND TABLES

- *genindex*
- *modindex*
- *search*
